To whom it may concern,

I am a recent graduate who aims to specialize in systems engineering and systems security. I am interested in having an opportunity to land on a role related to digital infrastructure such as developer operations and system engineer positions or roles related to computer security operations such as security operations analyst and auditing.

Currently, my experience comes from experimentation (with the help of my home lab where I test different technologies related to management, networking and security), running my own public infrastructure (by running self-hosted services for my own consumption as well as my colleagues), disclosures and reports submitted as an independent researcher and through challenges (such as CTF events). Addtionally, I have some experience with contributing to open source projects related to systems, networking or general day-to-day software.

I am a security-oriented individual who leans on to opertational security, privacy and awareness, applying these concepts on a personal basis and towards people and places around me. I am confident about getting to know new technologies or frameworks quickly given enough incentive (a goal) and resources to do so. I can juggle around using modern assistive tools when learning and working but I prefer using concrete information provided through existing documentation and experience of others. I love working with people share similar and deeper mindsets on systems and network infrastructure and I like to teach people about these concepts as well.

You can find out more about me through the attached CV and through my personal site: https://comradelab.win/about/

Thank you,
Loshana Aloka Dharmapriya <acursed_comrade@yahoo.com>
